

KEY DSH MANAGEMENT SOLUTIONS SERVICES

How the DMS Process Works

DMS is a hospital financial services consulting firm, not a software company, but the core of our services is a remote hosted, HIPAA compliant 700,000 line SQL-server-based proprietary application. This application (“MDSS[®]”) sends and reads data not only from the local State, but all adjacent States, and Medicare from which Title XIX/Title

XVIII/Title XVI recipients were deemed eligible for those benefits. Our system cross references and integrates current and historical hospital admission data, real-time regional and national Medicare, Medicaid and SSI eligibility/entitlement data; state-wide public discharge databases; and federal/state mandated benefit coverage rules-based tables.

This integration of these disparate data sources and overlay of State and Federal regulatory mandated benefit coverage produces the most robust DSH/340B system in the industry. The data flow between and among all these entities is a continuous, cyclic process that provides clients with the most up to date snapshot of their respective positions relative to DSH and 340B thresholds, and allows pro-

active management of this revenue stream.

To top it all off, DMS offers a full range of pricing options including a fully “at-risk” pricing model, regardless of what vendor has been, or is currently, working on this issue. Under this option *our payment is based on quantifiable, accretive financial benefits over and above what is established up-front as the baseline.*
